UPSC Q.C.A

5/4/18.

Q. Environmental Ethics?

Ans:-

Environmental ethics means the moral relationship between human and the environment. Environmental ethics play a major role in the preservation of the human beings as well as the other animals, microorganisms etc. These environmental ethics are necessary because everything in the environment is interrelated and closely linked with each other like the food web, balance of different gases in the ecosystem etc. All these things only sustain if we follow good environmental ethical values. All of us are the creation of nature and we depend on one another and the environment.

The environmental ethics makes us aware about the necessity of the existence of the nature and its growing part. All the part which comes under nature like the huge forests, different type of animals, valuable trees and green lands must be given enough respect as our life is totally dependent on these things. If and there is continuous increase in the percentage of deforestation that means we are destroying our environment by our own.

The environmental ethics helps us to build up a strong and trustworthy relationship

with the environment. Humans are so busy destroying these naturals just for its own development, since humans have forgotten that they are alive just because of the environment and have taken it as granted.

We need to totally overcome these issues within the time to save ourselves and our planet too. Many environmental related programmes are carried out just to make everyone aware about the well being of the environment and grow good environmental ethics among oneself. Nature always warns us from time to time for our irresponsible behaviour by increasing temperature, disturbance in the global warming index, less rainfall etc. We need to grow proper and efficient environmental ethics to cope up with these upcoming issues and to sustain human life on earth.
